Smart Contract Security Audit

BTC EARN TOKEN

Harry Kedelman
General Manager

Audit Result

© BTCEARN TOKEN has PASSED the smart contract security audit with below listed privileges.

(Other unknown security vulnerabilities are not included in the audit responsibility scope)

Audit Result: PASSED

Ownership: Not renounced yet

KYC Verification: NA at the date of report edition

Audit Date: October 04, 2022

Audit Team: CONTRACTCHECKER

Findings_ Privileges of Ownership

Auto liquidity is going to an externally owned account

⚠ Owner can exclude accounts from reward

Owner can exclude an account from paying fees

⚠ Owner can change the fees but with limit of 15% sell and 5% buy at max

Owner can change wallet to wallet transfer fees up to 5%

Owner can change max transaction amount within reasonable limits.

• Owner can change max wallet token amount within reasonable limits

Owner can change reward share settings

Trade must be enabled by the owner

Owner can change swap settings

Important Notice for Investors

As Contract Checker team we are mainly auditing the contract code to find out how it will be functioning, and risks which are hidden in the code if any.

There are many factors must be taken into consideration before investing to a project, like: ownership status, project team approach, marketing, general market condition, liquidity, token holdings etc.

Investors must always do their own research and manage their risk considering different factors which can affect the success of a project.

SUMMARY

CONTRACTCHECKER received an application for smart contract security audit of BTCEARN TOKEN on October 03, 2022, from the project team to discover if any vulnerability in the source codes of the BTCEARN TOKEN as well as any contract dependencies. Detailed test has been performed using Static Analysis and Manual Review techniques.

The auditing process focuses to the following considerations with collaboration of an expert team

- Functionality test of the Smart Contract to determine if proper logic has been followed throughout the whole process.
- Manually detailed examination of the code line by line by experts.
- Live test by multiple clients using Testnet.
- Analysing failure preparations to check how the Smart Contract performs in case of any bugs and vulnerabilities.
- Checking whether all the libraries used in the code are on the latest version.
- Analysing the security of the on-chain data.

Project Summary

Token Name BTCEARN TOKEN

Web Site NA

Twitter NA

Telegram NA

Platform Binance Smart Chain

Token Type BEP20

Language Solidity

Platforms & Tools Remix IDE, Truffle, Truffle Team, Ganache, Solhint, VScode, Mythril, Contract Library

Test Link https://testnet.bscscan.com/address/0x4f5a778aAe091E7eEACFEae9AA22B3CBE9cf0262

OVERVIEW

This Audit Report mainly focuses on overall security of BTCEARN TOKEN smart contract. Contract Checker team scanned the contract and assessed overall system architecture and the smart contract codebase against vulnerabilities, exploitations, hacks, and back-doors to ensure its reliability and correctness.

Auditing Approach and Applied Methodologies

Contract Checker team has performed rigorous test procedures of the project

- Code design patterns analysis in which smart contract architecture is reviewed to ensure it is structured according to industry standards and safe use of third-party smart contracts and libraries.
- Line-by-line inspection of the Smart Contract to find any potential vulnerability like race conditions, transaction-ordering dependence, timestamp dependence, and denial of service attacks.
- Unit testing Phase, we coded/conducted custom unit tests written for each function in the contract to verify that each function works as expected.
- Automated Test performed with our in-house developed tools to identify vulnerabilities and security flaws of the Smart Contract.

The focus of the audit was to verify that the Smart Contract System is secure, resilient, and working according to the specifications. The audit activities can be grouped in the following three categories:

Security

Identifying security related issues within each contract and the system of contract.

Sound Architecture

Evaluation of the architecture of this system through the lens of established smart contract best practices and general software best practices.

Code Correctness and Quality

A full review of the contract source code. The primary areas of focus include:

- Accuracy
- Readability
- Sections of code with high complexity
- Quantity and quality of test coverage

Risk Classification

Vulnerabilities are classified in 3 main levels as below based on possible effect to the contract.

High level vulnerability

Vulnerabilities on this level must be fixed immediately as they might lead to fund and data loss and open to manipulation. Any High-level finding will be highlighted with **RED** text

Medium level vulnerability

Vulnerabilities on this level also important to fix as they have potential risk of future exploit and manipulation. Any Medium-level finding will be highlighted with **ORANGE** text

Low level vulnerability

Vulnerabilities on this level are minor and may not affect the smart contract execution. Any Low-level finding will be highlighted with **BLUE** text

Vulnerability Checklist

Νō	Description.	Result
1	Compiler warnings.	Passed
2	Race conditions and Re-entrancy. Cross-function race conditions.	Passed
3	Possible delays in data delivery.	Passed
4	Oracle calls.	Passed
5	Front running.	Passed
6	Timestamp dependence.	Passed
7	Integer Overflow and Underflow.	Passed
8	DoS with Revert.	Passed
9	DoS with block gas limit.	Passed
10	Methods execution permissions.	Passed
11	Economy model.	Passed
12	The impact of the exchange rate on the logic.	Passed
13	Private user data leaks.	Passed
14	Malicious Event log.	Passed
15	Scoping and Declarations.	Passed
16	Uninitialized storage pointers.	Passed
17	Arithmetic accuracy.	Passed
18	Design Logic.	Passed
19	Cross-function race conditions.	Passed
20	Safe Zeppelin module.	Passed
21	Fallback function security.	Passed

Manual Audit:

For this section the code was tested/read line by line by our developers. Additionally, Remix IDE's JavaScript VM and Kovan networks used to test the contract functionality.

Smart Contract SWC Attack Test

SWC ID	D Description			
SWC-100	Function Visibility	Passed		
SWC-101	Integer Overflow and Underflow			
SWC-102				
SWC-103				
SWC-104				
SWC-105	/C-105 Unprotected Ether Withdrawal			
SWC-106	Unprotected SELFDESTRUCT Instruction	Passed		
SWC-107	Re-entrancy	Passed		
SWC-108	State Variable Default Visibility	LOW		
SWC-109	Uninitialized Storage Pointer	Passed		
SWC-110	Assert Violation	Passed		
SWC-111	Use of Deprecated Solidity Functions	Passed		
SWC-112	Delegate Call to Untrusted Callee	Passed		
SWC-113	DoS with Failed Call	Passed		
SWC-114	Transaction Order Dependence	Passed		
SWC-115	Authorization through tx.origin	Passed		
SWC-116	Block values as a proxy for time	Passed		
SWC-117	Signature Malleability	Passed		
SWC-118	Incorrect Constructor Name	Passed		
SWC-119	Shadowing State Variables	Passed		
SWC-120	Weak Sources of Randomness from Chain Attributes	LOW		
SWC-121	Missing Protection against Signature Replay Attacks	Passed		
SWC-122	Lack of Proper Signature Verification	Passed		
SWC-123	Requirement Violation	Passed		
SWC-124	Write to Arbitrary Storage Location	Passed		
SWC-125	Incorrect Inheritance Order	Passed		
SWC-126	Insufficient Gas Griefing	Passed		
SWC-127	Arbitrary Jump with Function Type Variable	Passed		
SWC-128	DoS With Block Gas Limit	Passed		
SWC-129	Typographical Error	Passed		
SWC-130	Right-To-Left-Override control character (U+202E)	Passed		
SWC-131	Presence of unused variables	Passed		
SWC-132	Unexpected Ether balance	Passed		
SWC-133	Hash Collisions with Multiple Variable Length Arguments	Passed		
SWC-134	Message call with hardcoded gas amount	Passed		
SWC-135	Code With No Effects (Irrelevant/Dead Code)	Passed		
SWC-136	Unencrypted Private Data On-Chain	Passed		

SWC-108: State variable visibility is not set

It is best practice to set the visibility of state variables explicitly. The default visibility for "WBNB" is internal. Other possible visibility settings are public and private.

```
327 IBEP20 public RewardToken =

328 IBEP20(0x78867BbEeF44f2326bF80Dd1941a4439382EF2A7);

address WBNB = 0xae13d989daC2f0dEbFf460aC112a837C89BAa7cd;

330 IDEXRouter router;
```

The default visibility for "router" is internal. Other possible visibility settings are public and private.

```
328 IBEP20(0x788678bEeF44f2326bF80Dd1941a4439382EF2A7);
329 address W6NB = 0xae13d989daC2f0dEbFf460aC112a837C898Aa7cd;
330 IDEXRouter router;
```

The default visibility for "shareholders" is internal. Other possible visibility settings are public and private.

```
330 IDEXRouter router;
331
332 address[] shareholders:
```

The default visibility for "currentindex" is internal. Other possible visibility settings are public and private.

```
346  uint256 public minDistribution = 1 * (10**18);
347
348  uint256 currentIndex;
```

The default visibility for "DEAD" is internal. Other possible visibility settings are public and private.

The default visibility for "_totalSupply" is internal. Other possible visibility settings are public and private.

The default visibility for "Denominator" is internal. Other possible visibility settings are public and private.

The default visibility for "_balances" is internal. Other possible visibility settings are public and private.

```
__totalSupply.mul(100).div(Denominator); // 1%

556

557 mapping(address => uint256) _balances;
```

The default visibility for "_allowances" is internal. Other possible visibility settings are public and private.

```
mapping(address => uint256) _balances;
mapping(address => mapping(address => uint256)) _allowances;
mapping(address => uint256)) _allowances;
```

The default visibility for "isFeeExempt" is internal. Other possible visibility settings are public and private.

```
560 // permissions
561
562 mapping(address => bool) isFeeExempt:
```

The default visibility for "isTxLimitExempt" is internal. Other possible visibility settings are public and private.

```
562 mapping(address => bool) isFeeExempt;
563 mapping(address => bool) isTxtLimitExempt;
564 mapping(address => bool) isMx8alanceLimitExempt;
```

The default visibility for "isMxBalanceLimitExempt" is internal. Other possible visibility settings are public and private.

```
565 mapping(address => bool) isTxLimitExempt;
564 mapping(address => bool) isMxBalancelimitExempt;
565 mapping(address => bool) isDividendExempt;
```

The default visibility for "isDividend Exempt" is internal. Other possible visibility settings are public and private.

```
mapping(address => bool) isTxLimitExempt;
mapping(address => bool) isMxBalanceLimitExempt;
mapping(address => bool) isDividendExempt;
mapping(address => bool) isDividendExempt;
```

The default visibility for "liquidityFee" is internal. Other possible visibility settings are public and private.

```
// Sell and buy fee

int256 liquidityFee = 100;

int256 developersFee = 200;
```

The default visibility for "developersFee" is internal. Other possible visibility settings are public and private.

The default visibility for "reflectionFee" is internal. Other possible visibility settings are public and private.

The default visibility for "marketingFee" is internal. Other possible visibility settings are public and private.

The default visibility for "totalSellFee" is internal. Other possible visibility settings are public and private.

```
573  uint256 marketingFee = 200;
574  uint256 totalSellFee =
575  liquidityFee + developersFee + reflectionFee + marketingFee;
```

The default visibility for "marketingTransferFee" is internal. Other possible visibility settings are public and private.

```
577 // Transfers

578 uint256 marketingTransferFee = 50;

579 uint256 developerTransferFee = 50;
```

The default visibility for "developer Transfer Fee" is internal. Other possible visibility settings are public and private.

```
578 uint256 marketingTransferFee = 50;

579 uint256 developerTransferFee = 50;

580 uint256 totalTransferFee = marketingTransferFee + developerTransferFee;
```

The default visibility for "totalTransferFee" is internal. Other possible visibility settings are public and private.

```
579  uint256 developerTransferFee = 50;
580  uint256  totalTransferFee = marketingTransferFee + developerTransferFee;
581
```

The default visibility for "targetLiquidity" is internal. Other possible visibility settings are public and private.

```
582 // this is related to swap

wint256 targetLiquidity = 25;
wint256 targetLiquidityDenominator = 100;
```

The default visibility for "targetLiquidityDenominator" is internal. Other possible visibility settings are public and private.

```
582 // this is related to swap

583 uint256 targetLiquidity = 25;

584 uint256 targetLiquidityDenominator = 100;
```

The default visibility for "distributor" is internal. Other possible visibility settings are public and private.

```
996 uint256 public launchedAtTimestamp;
997
998 DividendDistributor distributor;
```

The default visibility for "distributorGas" is internal. Other possible visibility settings are public and private.

```
599 address public distributorAddress;
600
601 uint256 distributorGas = 500000;
```

The default visibility for "inSwap" is internal. Other possible visibility settings are public and private.

```
604  uint256 public swapThreshold = _totalSupply / 2000; // 0.005%
605  bool inSwap;
606  modifier swapping() {
```

SWC-120: Potential use of "block.number" as source of randonmness

The environment variable "block.number" looks like it might be used as a source of randomness. Note that the values of variables like coinbase, gaslimit, block number and timestamp are predictable and can be manipulated by a malicious miner. Also keep in mind that attackers know hashes of earlier blocks. Don't use any of those environment variables as sources of randomness and be aware that use of these variables introduces a certain level of trust into miners.

```
gsz function launch() public authorized {
gss require(launchedAt == 0, "Already launched boi");
launchedAt = block number;
launchedAtTimestamp = block.timestamp;
gss }
```

Automated Audit

Remix Compiler Warnings

It throws warnings by Solidity's compiler. No issues found.

Disclaimer

This is a limited report on our findings based on our analysis, in accordance with good industry practice as at the date of this report, in relation to cybersecurity vulnerabilities and issues in the framework and algorithms based on smart contracts, the details of which are set out in this report. To get a full view of our analysis, it is crucial for you to read the full report. While we have done our best in conducting our analysis and producing this report, it is important to note that you should not rely on this report and cannot claim against us based on what it says or doesn't say, or how we produced it, and it is important for you to conduct your own independent investigations before making any decisions. We go into more detail on this in the below disclaimer below – please make sure to read it in full.

DISCLAIMER: By reading this report or any part of it, you agree to the terms of this disclaimer. If you do not agree to the terms, then please immediately cease reading this report, and delete and destroy all copies of this report downloaded and/or printed by you. This report is provided for information purposes only and on a non-reliance basis and does not constitute investment advice.
